SLASH YOUR FUEL BILLS – with a SCIMITAR

With rapidly rising fuel prices and forecasts for ongoing steep increases, Scimitar's amazingly low fuel consumption is more attractive than ever.

Bryan Bradford, Managing Director of Scimitar Marine, said the Award winning Scimitar 1010 uses less than 25% of the fuel consumed by many planing monohulls of a similar size. With fuel flows at cruising speeds of around 25 litres an hour, Scimitar's consumption is equivalent to some outboard-powered trailer boats.

Currently we are experiencing very strong enquiries from potential buyers who are not only conscious of fuel costs but also the environmental benefits of our fuel efficient power catamaran.

Scimitar's efficiency is achieved by a focus on drag reduction. The fine entry laminar-flow hull design combines with reduction of the internal compression wave between the hulls through its 5 metre beam. These important aspects set Scimitar apart from other vessels in the market.

Scimitar's almost legendary fuel economy and seagoing performance continue as a benchmark in the industry.
